[Biology Laboratory Manual Answers](#)

1. Your lab just discovered a new fruit fly mutant that produces flies with short legs. You therefore decided to name the mutant *dachshund* (*dac*). Based upon the results of two genetic crosses, you determined this *dac* mutant is due to a *recessive* mutation located on Chromosome II; you then performed several crosses with the deficiency lines listed above and obtain the results below:

Deficiency chromosome	Deleted segment
<i>Df(2L)N22-14</i>	29C1-30C9
<i>Df(2L)S1</i>	34C6-36B1
<i>Df(2R)BSC11</i>	50E6-51E4

Note: The *Df(2L)N22-14* chromosome has breakpoints 29C1-2 and 30C8-9, the *Df(2L)S1* chromosome has breakpoints 34C6-D1 and 36A6-B1, and the *Df(2R)BSC11* chromosome has breaking points 50E6-F1 and 51E2-4. The grey colored area indicates the deleted segment in each deficiency chromosome.

Genotype	Phenotype
<i>dac / dac</i>	Flies have short legs.
<i>dac / +</i>	Flies have legs of normal lengths.
<i>dac / Df(2L)N22-14</i>	Flies have legs of normal lengths.
<i>dac / Df(2L)S1</i>	Flies have short legs
<i>dac / Df(2R)BSC11</i>	Flies have legs of normal lengths.

(6 points) Based upon the result, can you determine roughly the cytological location of the *dac* gene? If so, where, and why.
